

## **Pies**

Expression patterns of individual families of cytoskeletal genes analysed (total 192 genes) among four categories. Male gametophyte-specific (dark blue) and non-specific (purple) genes were both expressed in at least one stage of the male gametophyte development. Moreover, pollen-specific genes did not give a positive expression signal in any sporophytic datasets. Non-expressed genes (yellow) were not expressed in the male gametophyte and the last category (light blue) comprises genes absent from the Affymetrix ATH1 Genome Array.
